

BrandPedia Kids - 测试、集成与部署指南 / Test, Integration & Deployment Guide

保证参赛项目可运行、可演示、可解释的工程检查手册

Document Purpose

- Covers integration sequence, manual QA, content QA, deployment, backup plan, and demo runbook.

Prepared for Grade 11/12 IAI²O AI for Business project coaching. Source-aligned with the uploaded BrandPedia Kids product proposal.

1. Integration Sequence / 集成顺序

Order	Integration Item	Reason
Step 1	Static homepage + brand data	No AI dependency; stable visual base.
Step 2	Brand detail pages for 5 brands	Core content demo becomes available.
Step 3	Podcast player with local/pre-generated audio	Avoids slow live TTS during demo.
Step 4	Mock AI generation API	Shows the product flow before risking real APIs.
Step 5	Optional real LLM/TTS integration	Only after schema, cache, and fallback are ready.
Step 6	Quiz, recommendations, responsive polish	Improves education value and user experience.
Step 7	Deployment + backup demo package	Ensures competition readiness.

2. Manual Test Checklist / 手动测试清单

Module	Test Items	Status
Homepage	Page loads; category filter works; search works; cards are clickable; no overflow.	Pass / Fix
Detail Page	Correct brand content; six modules visible; related brands link correctly.	Pass / Fix
Podcast	Play/pause works; progress changes; speed control works; no layout blocking.	Pass / Fix
AI Generate	Brand input validates; loading appears; success page displays; failure message is friendly.	Pass / Fix
Quiz	Questions display; selecting answer shows feedback; score is correct.	Pass / Fix
Responsive	Desktop/tablet/mobile all readable; buttons are tappable; no horizontal scroll.	Pass / Fix
Content Safety	No unsupported sensitive claims; child-friendly language; no official/copyrighted images copied.	Pass / Fix
Demo Backup	Backup screenshots, local data, and pre-generated content available.	Pass / Fix

3. Content Quality Rubric / 内容质量评分

Criterion	Evidence	Max Score
Factuality	Every major brand fact has a source to check; uncertain claims are softened or removed.	5

Child-Friendly Explanation	Concepts like pricing, supply chain, revenue, and marketing are explained with examples a 6-14-year-old can understand.	5
Business Insight	The content teaches how the brand makes money and competes, not only brand history.	5
AI Value	AI generation clearly improves scalability and personalization.	5
Safety & Copyright	Avoids official logo misuse, copyrighted characters, unsafe content, and exaggerated claims.	5

4. Deployment Guide / 部署指南

- Prepare environment variables: LLM key, TTS key, Supabase URL/key only if real services are used.
- Push code to GitHub and connect repository to Vercel.
- Set build command and environment variables in Vercel.
- Deploy preview first; test the locked demo path; then promote final deployment.
- Keep a local backup: exported screenshots, short screen recording, sample generated JSON, and static demo data.
- Never expose API keys in frontend code or screenshots.

5. Demo Runbook / 演示脚本

Stage	Action
Before demo	Open deployment link; test audio; open backup screenshots; prepare sample brand input; close unrelated tabs.
Opening	State the problem: children know brands but rarely understand business logic behind them.
Product flow	Show logo wall -> one brand detail -> podcast/card sync -> quiz -> new brand exploration.
AI explanation	Explain LLM structured content, TTS podcast, safe illustration prompts, cache and review.
Business explanation	Explain freemium, B2B licensing, brand cooperation, and education value.
Fallback	If real AI is slow, show pre-generated result and explain cache strategy.
Closing	Summarize differentiation: clear user, AI-driven scalable content, educational value, business potential.
